No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                         653

The present invention describes polynucleotide sequences (I) which encode prostate-specific proteins (II). (I) and (II) have cytostatic activity, and can be used in vaccine production and gene therapy. (II), (II), antibodies to (II), fusion proteins comprising (II), and isolated T cells prepared using (I) or (II) area used treat cancer in a patient. (I) and the antibodies are also used in the detection of cancer in a patient. (I) and (II) can be used in vaccines. The antibodies or (I) can be used for wonitoring the progression of cancer in a patient. (I) and (II) can be used to improve diagnostic and therapeutic methods for prostate cancer. They can indicate the level of metastasis as well as the prostate volume. AAH93357 to AAH93394 and AAM01115 to AAM01318 represent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 GlyAspValIleSerValThrTrpGlnThrLysSerGlyGlyThrArgThrGlyAsnVal 120

The invention relates to isolated prostate-specific polynuclectides, polypeptides, fusion proteins of the polypeptides, antibodies raised against the polypeptides (or antigenic epitopes derived from them) and antigen-presenting cells expressing the polypeptides. The antibodies are useful for detecting the presence of cancer, especially prostate cancer. The polypeptides, polynuclectides and the antigen-presenting cells are useful for stimulating and/or expanding T cells specific for a tumour protein, and for inhibiting the development of cancer especially prostate cancer. Compositions comprising the polynuclectide and/or polypeptide are useful for stimulating an immune response, and for treating cancer. The oligonuclectide is useful for detecting cancer. The prostate specific polynuclectide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       GCCTTCCTCGGCTTTGGGTGTTGTCGACAACAACGGCAACGGCGCACGAGTCCAACGCGTG 201

The invention describes a fusion protein comprising at least one amino acid sequence of immunogenic portions of any of the 3 sequences not defined in the specification, or sequences having at least 70 or 90 % sequence identity to any one of the 35 sequences defined in the USPTO web site, which is encoded by any of the 4 nucleotide sequences not defined in the specification. The fusion protein, composition and methods are useful for diagnosing, preventing and/or treating cancer, particularly prostate cancer. The proteins are useful as markers to indicate the presence or absence of cancer. This sequence represents a prostate cancer therapy associated cNNA. Note: The sequence data for this parent did not form part of the printed specification, but was obtained in electronic format directly from the US patent office at sequence.html?DocID=US20020192763
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          141
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           201
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             261
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               100
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              321
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  381
Prostate specific protein and its encoding polynucleotide, useful for the treatment and diagnosis of prostate cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             80
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         20
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      81

These can be used in the diagnosis and treatment of cancers, particularly prostate cancer. The present sequence is a cDNA described in the invention. (Updated on 29-AUG-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Kalos MD;

The present invention relates to novel prostate-specific proteins (PSP) and their coding sequences. The PSPs and their coding sequences are useful for stimulating an immune response in a patient, or for treating prostate cancer in a patient and for determining, detecting or diagnosing the presence of a cancer in a patient. The present sequence was used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AspGlyAlaProlleAsnSerAlaThrAlaMetAlaAspAlaLeuAsnGlyHisHisPro 100

The invention relates to an isolated polypeptide comprising no more than content and acids of ADB13563 comprising a sequence ADB14487. The peptides comprise a fragment ADB13563 of that contain naturally processed T-cell epitopes for 3 class I major histocompatibility complex (WHC) alleles. ADB13563 is a polypeptide encoded by a human prostate specific companion one of 648 disclosed as new. Also included are nucleic acids encoding the proteins and peptides, expression vectors, a host cell tragment) that specifically binds to the protein or peptide, detecting cragment) that specifically binds to the protein or peptide, detecting the presence of a cancer in a patient (comprising contacting a patient cample with a binding agent that binds to the protein or peptides or a polypeptide to a predetermined cutcomparing as ADB13588, detecting the amount of polypeptide to a predetermined cutcomparing the amount of polypeptide to a predetermined cutcomparing the peptides or proteins, stimulating or expanding T cells specific for a tumour protein comprising or cancer; a fusion protein comprising contacting T cells specific for a tumour protein comprising contacting T cells specific for a tumour protein comprising contacting T cells specific for a tumour protein comprising contacting T cells or composition comprising the peptides, or composition comprising the peptides, or composition comprising the peptides or composition comprising cluster of differentiation (CD4+) and/or CD8+ T cells in the peptides or antigen presenting cells that express (the peptides so that the T cells proliferate, and administering the composition comprised contacting the peptides or antigen presenting cluster of differentiation (CD4+) and/or CD8+ T cells in the peptides or antigen presenting cluster of differentiation (CD4+) and/or CD8+ T cells to the patient. The peptides (or an oligonucleotide contact in a patient and really proliferate, and administering the peptides or composition contacting a so that that thy the peptides (or an oligonucleotide 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New isolated polypeptide for use in a vaccine for stimulating an immune response, or for treating or diagnosis cancer, preferably prostate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Example 17; Page; 101pp; English.

antigen-presenting cells expressing the nucleic acid, are used to stimulate or expand T cells specific for a tumour protein. The peptides, nucleic acids, antibodies, fusion proteins, T cell populations or antigen presenting cells are used to etimulate an immune response or treat prostate cancer in a patient. The present sequence is a cDNA encoding a fusion protein comprising a prostate specific protein. Note: Except where otherwise indicated, the sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from USPTO at seqdata.uspto.gov/sequence.html?DocID=20030185830.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AspGlyAlaProlleAsnSerAlaThrAlaMetAlaAspAlaLeuAsnGlyHisHisPro 100

The invention describes an isolated polymucleotide and polypeptide useful for stimulating and/or expanding T cells specific for a tumour protein containing the presence of a cancer in a patient. A composition a lung cancer in a patient. The polympeptide is useful for treating a lung cancer in a patient. The polympeptide is useful for treating a rolls from a biological sample. The polymorleotide is also useful as probe or primer to detect the level of many according a tumour protein. This sequence encodes a lung tumour associated protein or protein. Fragment, described in the method of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at

The invention relates to a polymucleotide encoding a lung tumour protein, comprising a sequence selected from any of the 14 sequences mentioned in protein comprising a sequence selected from any of the 14 sequences mentioned in complement of S1, sequences consisting of at least 20 contiguous residues of S1, sequences that hybridise to S1, sequences having 75%, preferably CC obly identity to S1, or degenerate variants of S1. Also included are an isolated polypeptide (comprising a sequence (S1) selected from any one of the 4 amino acid sequences mentioned in the specification, a sequence corrected by the polymucleotide, or sequence shaving at least 70%, control sequence encoded by the polymucleotide, or sequence by the polymucleotide, or sequence and the specification, and sequence a host cell transformed or transfected with corrected by the polymucleotide, or a sequence, a host cell transformed or transfected with the vector, an isolated antibody (or its antigen-binding fragment) that the vector, a fusion protein comprising the polymptide, detecting the presence of a cancer of a funder or protein (comprising to the polypeptide, and the polymucleotide, protein conditions, stimulating and/or expanding T cells specific for a tumour conditions, stimulation and/or expansion of T cells) and inhibiting the development of a cancer in a patient with the polymucleotide, protein or antigen presenting cells, under conditions and for a time sufficient comprision contacting cells that express the polymucleotide, protein or antigen presenting cells, under conditions and for a time sufficient consistence administering to the patient an effective amount of the patient. The polymucleotide, protein or a patient. The polymucleotide, protein or a patient. The polymucleotide, protein or presenting cells, and thus inhibiting the development of a cancer in the patient. The patient is and thus inhibiting and a patient, and patient is a patient, and patient isu
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel lung cancer polynucleotide encoding lung cancer protein, useful for detecting the presence of lung cancer in a patient, and in pharmaceutical compositions, e.g. vaccines, for treating lung cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Wang T, Switzer AP, Mcneill PD;

treating a cancer in a patient (particularly lung cancer). The oligonucleotide is useful for determining the presence of a cancer in a patient. The protein and oligonucleotides are useful in pharmaceutical compositions, e.g. vaccines. The polymucleotide is also useful as a probe or primer for nucleic acid hybridisation, and in the design and preparation of ribozyme molecules for inhibiting expression of tumour polymeptides and proteins in tumour cells. An amplified portion of the polymeptides and proteins in tumour cells. An amplified portion of the library. The present sequence encodes a fusion protein of human RAL2 with the protein product of a cDNA (full length, extended or partial) isolated from a library derived from lung tumour/cancer cells. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the USPTO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  141
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   201

The invention describes an isolated polynucleotide comprising one of 32 sequences, complement or degenerate variants of them. The polynucleotide is useful for preparing a composition e.g. a vaccine or for gene therapy, for treating or inhibiting development of cancer, e.g. lung cancer. This sequence represents a polynucleotide associated with the compositions and methods for the therapy and diagnosis of lung cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New polynucleotide, useful for preparing a composition for treating inhibiting development of cancer, e.g. lung cancer.
                                                                                                                                                                                                                                                                                                                                                                                 Henderson RA, Wang T, Watanabe Y, Johnson JC, Retter MW;

The invention relates to an isolated polymucleotide (I) encoding a polypeptide (II) comprising at least a portion of a colon tumour protein. C polypeptide (II) comprising at least a portion of a colon tumour protein.

(I), (II) and antibody (III) to (II) or antigen presenting cells expressing (I) is useful for stimulating and/or expanding T cells or specific for a tumour protein, by contacting T cells with (I), (II) or antigen-presenting cells that express (I), under conditions and for a cime sufficient to permit the stimulation and/or expansion of T cells.

(I), (II), or antigen presenting cells that express (II) are useful for treating colon cancer in a patient by incubating CD4+ and/or CD8+ T cells (I), (II) or antigen presenting cells that express (II), such that T cells proliferate, and administering to the express (II), such that T cells proliferate, and administering to the express (II), such that T cells proliferate, and administering to the concines and pharmaceutical compositions for prevention and treatment of colon malignancies and for the diagnosis and monitoring of such cancers.

(I), (II) or (III) is useful for detection, diagnosis and/or therapy of human colon cancer. (I) is useful as a probe or primer for nucleic acid hybridisation, and in the dessign and preparation of ribozyme molecules colon malignation of (II) in tumour cells. ABK27864-ABK27807 crepresent novel human colon cancer coding sequences and primers of the invention

                                            The present invention describes human lung tumour proteins. Human lung activities and polymucleotides have cytostatic and immunostimulant activities, and can be used in vaccine production. Compositions comprising the lung tumour proteins, polymucleotides, antibodies, fusion proteins, T cell populations, or antigen presenting cells that express stimulating an immune response. ABL48959 to ABL49300 and ABB74946 to ABB75070 represent sequences used in the exemplification of the present

Novel lung carcinoma polynuclectide sequences and polypeptides encoded the polynuclectides, useful in pharmaceutical compositions such as vaccines and as markers to indicate the presence of lung cancer.

ģ

Claim 8; Page 340-341; 381pp; English.

The present invention describes isolated human lung carcinoma polymucleotides (I) and polymeptides (II). (I) and (II) have cytostatic polymucleotides (I) and polymeptides (II). (I) and (II) have cytostatic activity, and can be used in gene therapy and in vaccines. Compositions comprising (I) or (II) can be used for stimulating an immune response in a patient and for treating the used for detecting the presence of a cancer in a patient, by obtaining a biological sample from the patient, contacting the biological sample from the patient, contacting the biological sample with the oligonucleotide, detecting in the sample, an amount of sample with the oligonucleotide of electric oligonucleotide and comparing the prodetermined cut-off value, and determining the presence of a cancer in the patient. (I) and (II) are useful in pharmaceutical compositions, e.g. vaccines. (I) is useful as a marker to indicate the presence or absence of a cancer such as lung cancer. ABQ92145 to ABQ92486 and ABP61866 to ABQ92192 represent sequences used in the exemplification of the present Invention

```

The invention describes isolated polynucleotides and polypeptides useful for diagnosing, preventing and/or treating cancer, particularly lung cancer. A new isolated polynucleotide comprises: any of the 22 fully defined nucleotide sequences (e.g. 1012, 900 or 2773 bp) given in the specification; complements of the nucleotide sequences cited above; at least 10 contiguous residues of the nucleotide sequences cited above; a sequence that hybridise to any of the nucleotide sequences under highly stringent conditions; a sequence that is at least 75 or 90% identical to the above nucleotide sequences; or degenerate variants of the above the above nucleotide sequences. The composition and methods are useful in diagnosing, preventing and/or treating cancer, particularly lung cancer, in gene therapy and in vaccines. This sequence encodes a fusion protein of human lung tumour protein L673P C-terminal and Ral2. New isolated polynucleotides and polypeptides useful for diagnosing, preventing and/or treating cancer, particularly lung cancer. Claim 8; Page 253; 296pp; English.

The present invention describes polymucleotide sequences (I) which encode prostate-specific proteins (II). (I) and (II) have cytostatic activity, and can be used in vaccine production and gene therapy. (I), (I), (II), fusion proteins comprising (II), and isolated T cells prepared using (I) or (II) are used treat cancer in a patient. (I) and the antibodies are also used in the detection of cancer in a patient. The cancer that is diagnosed or treated is particularly prostate cancer. (I) and (II) can be used in vaccines. The antibodies or (I) can be used for monitoring the progression of cancer in a patient. (I) and (II) can be used to improve diagnostic and therapeutic methods for prostate cancer. They can indicate the level of metastasis as well as the prostate volume. AAH93357 to AAH93944 and AAM01115 to AAM0118 represent

                                                                                                     ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to isolated prostate-specific polymucleotides, polypeptides, fusion proteins of the polypeptides, antibodies raised against the polypeptides (or antigenic epitopes derived from them) and antigen-presenting cells expressing the polypeptides. The antibodies are useful for detecting the presence of cancer, especially prostate cancer. The polypeptides, polymucleotides and the antigen-presenting cells are useful for stimulating and/or expanding T cells specific for a tumour protein, and for inhibiting the polymucleotide and/or poppide are useful for stimulating an immune response, and for treating cancer. The oligonucleotide is useful for detecting cancer. The prostate specific polymucleotide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    GlyGlnAlaMetAlaIleAlaGlyGlnIleLySLeuProThrValHisIleGlyProThr 40

The invention describes a fusion protein comprising at least one amino acid sequence of immunogenic portions of any of the 3 sequences not defined in the specification, or sequences having at least 70 or 90 % sequence identity to any one of the 35 sequences defined in the USPTO web site, which is encoded by any of the 4 nucleotide sequences not defined in the specification. The fusion protein, composition and methods are useful for diagnosing, preventing and/or treating cancer, particularly prostate cancer. The proteins are useful as markers to indicate the presence or absence of cancer. This sequence represents a prostate cancer therapy associated oDNA. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic form at directly from the US patent office at

```
The present invention provides prostate-specific coding sequences and their encoded proteins. These can be used in the diagnosis and treatment of cancers, particularly prostate cancer. The present sequence is a cDNA described in the invention. (Updated on 29-AUG-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Kalos MD;
Carter D;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New prostate-specific polymucleotides for diagnosing and treating diseases, in particular prostate cancer, and as markers for the progression of cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                U; 0 Other;

The present invention relates to novel prostate-specific proteins (PSP) and their coding sequences. The PSPs and their coding sequences are useful for stimulating an immune response in a patient, or for treating prostate cancer in a patient and for determining, detecting or diagnosing the presence of a cancer in a patient. The present sequence was used to illustrate the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             100

nucleic acids, antibodies, fusion proteins, T cell populations or antigen presenting cells are used to stimulate an immune response or treat prostate cancer in a patient. The present sequence is a cDNA encoding a fusion protein comprising a prostate specific protein. Note: Except where otherwise indicated, the sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from USPTO at sequence.html?DocID=20030185830.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   81 AspGlyAlaProlleAsnSerAlaThrAlaMetAlaAspAlaLeuAsnGlyHisHisPro 100

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to an isolated polypeptide comprising no more than 11-542 amino acids of ADB13563 comprising a sequence ADB1487. The peptides comprises a fragment ADB13563 of that contain naturally processed T-cell epitopes for 3 class I major histocompatibility complex (MMC) alleles. ADB13563 is a polypeptide encoded by a human prostate specific cord. The proteins and peptides, expression vectors, a nest cell transformed with the vector, an isolated antibody (or antigen binding transformed with the vector in a patient (comprising contacting a patient of reagment) that specifically binds to the protein or peptide, detecting the amount of polypeptide or a polypeptide sample with a binding agent that binds to the peptides or a polypeptide cappearing as ADB1358, detecting the amount of polypeptide to a predetermined cutoff value to determine the presence of cancer), a fusion protein coff value to determine the presence of cancer), a fusion protein comprising the peptides or proteins stimulating or expanding T cells specific for a tumour protein comprising contacting T cells with the specific for a tumour protein comprising contacting prostate cancer in a patient and treating prostate cancer in a patient with the peptides or antigen presence of cancer in a patient and treating prostate cancer in a patient with the peptides or antigen presented or an oligonucleotide from that thybridises to nucleic acids encoding them), is used to detect the comprising calls to the patient. The peptides (or an oligonucleotide that hybridises to nucleic acid encoding them), is used to detect the cancer in a patient or appearance of cancer in a patient. The peptides, and encoding them and the peptides or antigen-presenting cells expressing the nucleic acid, are used to cancer in a patient. The peptides is nucleic acids encoding them attimulate or expand I cells specific for a tumour protein. The peptides, are used to detect the antigen-presenting cells the peptides or antigen-presenting cells expressing the nucleic acid, are use
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New isolated polypeptide for use in a vaccine for stimulating an immune response, or for treating or diagnosis cancer, preferably prostate

The invention describes an isolated polynucleotide and polypeptide useful for stimulating and/or expanding T cells specific for a tumour protein for determining the presence of a cancer in a patient. A composition containing the polynucleotide and/or polypeptide is useful for treating a lung cancer in a patient. The polynucleotide is useful for treating a lung cancer in a patient. The polynucleotide is also useful as probe or primer to detect the level of mRNA ancoding a tumour protein. This sequence encodes a lung tumour associated protein or protein. Trament, described in the method of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at they bublished_pot_sequences
                                                                                                                                                                                                                                                                                                                            Novel polynucleotide encoding a lung tumor polypeptide useful for stimulating and/or expanding T cells specific for a tumor protein

```

Novel lung cancer polynucleotide encoding lung cancer protein, useful for detecting the presence of lung cancer in a patient, and in pharmaceutical compositions, e.g. vaccines, for treating lung cancer.

Example 8; Page; 72pp; English.

The invention relates to a polymucleotide encoding a lung tumour protein, comprising a sequence selected from any of the 14 sequences mentioned in the specification, or a sequence (S2) mentioned in specification, or a sequence consisting of at least 20 contiguous residues complement of S1, sequences consisting of at least 20 contiguous residues of S1, sequences that hybridise to S1, sequences having 75%, preferably complement by Lo S1, or degenerate variaties of S1. Also included are an isolated polypeptide (comprising a sequence sequence from any one of the 4 amino acid sequences mentioned in the specification, a sequence concoded by the polymucleotide, or sequences having at least 70%, comprising the polymucleotide operably linked to an expression vector comprising the polymucleotide operably linked to an expression vector comprising the polymucleotide operably linked to an compression control sequence, a host cell transformed or transfected with the vector, an isolated antibody (or its antigen-binding fragment) that expression controls expending the presence of a cancer of a protein (comprising contacting) collises to S1 under moderately stringent conditions, stimulating and/or expanding T cells specific for a tumour or antigen presenting cells, under conditions and for a time sufficient to permit the stimulation and/or expanding T cells specific for a tumour contaction presenting cells, under conditions and for a time sufficient collisated from a patient (by incubating CD4 + and/or CD8 cells isolated from a patient with the polymucleotide, protein or presenting cells, under express the polymucleotide, protein or composition and thus inhibiting the development of a cancer in a patient with the polymucleotide, protein or stimulating and immune response in a patient (patient (patient, and thus inhibiting the development of a cancer in a patient (patient express the polymucleotide, protein or antigence of a cancer in a patient (patient express). The composition for stimulating and immune response in a patient (

```
patient. The protein and oligonucleotides are useful in pharmaceutical compositions, e.g. vaccines. The polymucleotide is also useful as a probe or primer for nucleic acid hybridisation, and in the design and preparation of ribozyme molecules for inhibiting expression of tumour polymeptides and proteins in tumour cells. An amplified portion of the polymeptides and proteins in tumour cells. An amplified portion of the polymoleotide is useful for isolating a full-length gene from a suitable library. The present sequence encodes a fusion protein of human RAL2 with the protein product of a cDNA (full length, extended or partial) isolated from a library derived from lung tumour/cancer cells. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the USPTO at sequence.html?DocId=20020197669
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               100

The invention describes an isolated polynucleotide comprising one of 32 sequences, complement or degenerate variants of them. The polynucleotide is useful for preparing a composition e.g. a vaccine or for gene therapy, for treating or inhibiting development of cancer, e.g. lung cancer. This sequence represents a polynucleotide associated with the compositions and methods for the therapy and diagnosis of lung cancer.
                                                                                                                                                                                                                                                                                                                                                       or

The present invention describes isolated human lung carcinoma polymucleotides (I) and polypeptides (II). (I) and (II) have cytostatic activity, and can be used in gene therapy and in vaccines. Compositions comprising (I) or (II) can be used for stimulating an immune response in a patient and for treating lung cancer in a patient. Oligonucleotides of (I) can be used for detecting the presence of a center in a patient, by obtaining a biological sample from the patient, contacting the biological sample with the oligonucleotide, detecting in the sample, an amount of polymucleotide that hybridises to the oligonucleotide and comparing the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel lung carcinoma polynucleotide sequences and polypeptides encoded by the polynucleotides, useful in pharmaceutical compositions such as vaccines and as markers to indicate the presence of lung cancer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention describes human lung tunnour proteins. Human lung tunnour proteins and polynucleotides have eytostatic and immunostimulant activities, and can be used in vaccine production. Compositions comprising the lung tunnour proteins, polynucleotides, antibodies, fusion proteins, T cell populations, or antigen presenting cells that express the lung tunnour proteins are useful for treating lung cancer or stimulating an immune response. ABL48559 to ABL49300 and ABB74946 to ABB75070 represent sequences used in the exemplification of the present
                                                                                                                                                                                                                                                  Human; lung tumour; lung cancer; cytostatic; immunostimulant; vaccine; immune response; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Polynucleotides encoding lung tumor polypeptides, useful for treating lung cancer or stimulating an immune response.

The invention describes isolated polynuclectides and polypeptides useful for diagnosing, preventing and/or treating cancer, particularly lung cancer. A new isolated polynuclectide comprises: any of the 22 fully defined nucleotide sequences (e.g. 1012, 900 or 2773 bp) given in the specification; complements of the nucleotide sequences cited above; at sequence that hybridise to any of the nucleotide sequences cited above; a sequence that hybridise to any of the nucleotide sequences under highly stringent conditions; a sequence that is at least 75 or 90% identical the above nucleotide sequences; or degenerate variants of the above the above nucleotide sequences. The composition and methods are useful in nucleotide sequences. The stringent cancer, particularly lung cancer, in gene therapy and in vaccines. This sequence encodes a fusion protein of human lung tumour protein L673P N-terminal and Ral2.
                                                                                                                                                                                                                                                                                                Wang T, Wang A, Skeiky YAW, Li SX, Kalos MD, Henderson RA;

The present invention describes compounds (1) for the immunotherapy and diagnosis of colon cancer. Also described: (1) a method for detecting the presence of cancer in a patient; (2) a method for stimulating and/or expanding T cells specific for a tumour protein; (3) an isolated T cell population comprising T cells prepared by the method of (2); (4) a method for stimulating an immune response in a patient; (5) a method for tradical cancer in a patient; and (6) a method for inhibiting the development of cancer in a patient. (1) have immunostimulant and evelopment of cancer in a patient. (1) have immunostimulant and and Apps3543 to Apps351 represent human colon cancer/tumour related sequences used in the exemplification of the present invention
                                                                                                                                                                                        244 GACGGCGCTCCGATCAACTCGGCCACCGCGATGGCGGGATGACGGGCTTAACGGGGATCATCCC 303

The WTI polynucleotides and polypeptides are used for treating and detecting cancer in a patient, and for stimulating an immune response in patient ABK69648-ABK69724 represent WTI coding sequences and PCR primers of the invention

The invention relates to an isolated Wilm tumour (WTI) polymucleotide comprising a full length protein, truncated protein, mutated protein or fusion protein. Also included are the encoded WTI proteins, expression vectors, host cells, antibodies, detecting the presence of a cancer in a partient by contacting a biological sample with a binding agent that binds to a WTI protein, an oligomucleotide that hybridises to a WTI compression or antigen. Presenting T cells with the WTI polymucleotide, the WTI protein or antigen. Presenting T cells with the WTI polymucleotide, the WTI protein, and a second component selected from the WTI polymucleotide, the WTI protein, inhibiting the CC composition (CI) (comprising physiologically acceptable carriers and composition (CI) (comprising physiologically acceptable carriers and composition calls that express the WTI protein, inhibiting the CC development of a cancer in a patient (by incubating CD4+ and/or CD8+ T cells isolated from a patient with the WTI polymucleotide, the WTI protein, inhibiting the CC development of a cancer in a patient (by incubating CD4+ and/or CD8+ T cells isolated from a patient with the WTI polymucleotide, the WTI cells isolated from a furger presenting cells that express the WTI polymucleotide, the WTI cells isolated from a furgen presenting cells that express the WTI polymucleotide, the WTI cells for the patient (CZ) (comprising a WTI polympetide resuspended in a composition (CZ) (comprising a wTI polympetide resuspended in a composition (CZ) (comprising a wTI polympetide resuspended in a patient of an immunogenic portion of WTI polympetides or and MFP-SE or Enhanzyn). Also disclosed as anew are polympetides or protein are useful for stimulating immune response in a patient, and patient, for writing and treating metastatic diseases cancer. CI is useful for inhibiting the development of a malignant composition as mapple. Ab (binding agent for the WTI protein is useful semple and protein are conventing and treating metastatic for determining a fundar co

cells from a biological sample. The polynucleotide is also useful as probe or primer to detect the level of mRNA encoding a tumour protein. This sequence encodes a lung tumour associated protein or protein fragment, described in the method of the invention. Note: The sequence data for this parent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pot_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         82 GGGCAGGCGATGGCGATCGCGGGCCAGATCAAGCTTCCCACCGTTCATATCGGGCCTACC

A composition containing the polynucleotide and/or polypeptide is useful for treating a lung cancer in a patient. The polypeptide is useful for treating a

Novel lung cancer polymucleotide encoding lung cancer protein, useful for detecting the presence of lung cancer in a patient, and in pharmaceutical compositions, e.g. vaccines, for treating lung cancer.

Example 10; Page; 72pp; English.

The invention relates to a polynucleotide encoding a lung tumour protein, comprising a sequence selected from any of the 14 sequences mentioned in the specification, or a sequence (S2) mentioned in specification, complement of S1, sequences consisting of at least 20 contiguous residues of S1, sequences that hybridise to S1, sequences having 75*, preferably 90*, identity to S1, or degenerate variants of S1. Also included are an isolated polympetide (comprising a sequence (S3) selected from any one of the 4 amino acid sequences mentioned in the specification, a sequence encoded by the polymucleotide, or sequence having at least 70*, preferably 90*, identity to a sequence encoded by the polymucleotide, and expression overcor comprising the polymucleotide operably linked to an expression control sequence, a host cell transformed or transfected with the vector, an isolated antibody (or its antigen-binding fragment) that expression control sequence, a host cell transformed or transfected with the vector, an isolated antibody (or its antigen-binding fragment) that conditions, stimulating and/or expanding T cells specific for a tumour protein comprising or the polympetide, detecting the presence of a cancer of antigen-presenting cells, under conditions and for a time sufficient or antigen-presenting cells, under conditions and for a time sufficient conditions, stimulating and/or expanding T cells specific for a time sufficient content of a cancer in a patient (by incubating CD4* and/or CD8*, T cells isolated from a patient (by incubating CD4* and/or CD8*, T cells isolated from a patient with the polymucleotide, protein or antigen presenting cells, and thus inhibiting the development of a cancer in a patient (particularly lung cancer in a patient (patient) and inmune response in a patient of patient and protein and oligomolectid polypeptides and proteins in tumour cells. An amplified portion of the polymuclectide is useful for isolating a full-length gene from a suttable library. The present sequence encodes a fusion protein of human RA12 with the protein product of a cDNA (full length, extended or partial) isolated from a library derived from lung tumour/cancer cells. Note: The sequence from a library derived from lung tumour/cancer cells. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from tl segdata.uspto.gov/sequence.html?DocId=20020197669

```
The invention relates to a recombinant nucleic acid molecule encoding a fusion polypeptide, comprising a polynucleotide sequence of Ral2, a 14 Mycobacterium tuberculosis, and a heterologous polynucleotide sequence. The recombinant fusion nucleic acids and polypeptides are useful for providing stable and high yield expression of fusion polypeptides of both cukaryotic and prokaryotic origin and to encode a protein product for use as an antigen for detecting serum antibodies. The presence of serum antibodies to M. tuberculosis antigens in an individual indicates that the individual is infected with it. The fusion polypeptides are useful as cources of proteins for monitoring binding of serum antibodies to fusion proteins and as an immunogen to induce and/or enhance immune responses. The coding sequences can be ligated with a coding sequence of another molecule such as M. tuberculosis antigens, a cytokine or an adjuvant and can be used in vivo as a DNA vaccine. This polynucleotide sequence
                                                                                                          Recombinant nucleic acid molecule for producing high yield expression of desired fusion polypeptides, encodes fusion polypeptide comprising Mycobacterium tuberculosis coding sequence and heterologous polypeptide.
                                                                                                                                                                                                                 Claim 1; Fig 2; 39pp; English

Skeiky Y, Guderian J;

WPI; 2001-266299/27. P-PSDB; AA022141. Recombinant nucleic acid molecule for producing high yield expression of desired fusion polypeptides, encodes fusion polypeptide comprising Mycobacterium tuberculosis coding sequence and heterologous polypeptide.

Disclosure, Fig 5; 39pp; English

The invention relates to a recombinant nucleic acid molecule encoding a fusion polypeptide, comprising a polymucleotide sequence of Ral2, a 14 Mycobacterium intervalsing a polymucleotide sequence of Ral2, a 14 Mycobacterium tuberculosis, and a heterologous polymucleotide sequence. The recombinant fusion nucleic acids and polypeptides are useful for providing stable and high yield expression of fusion polypeptides of both cukaryotic and prokaryotic origin and to encode a protein product for use as an antigen for detecting serum antibodies. The presence of serum antibodies to M. tuberculosis antigens in an individual indicates that the fusion polypeptides are useful as cources of proteins for monitoring binding of serum antibodies to fusion proteins and as an immunogen to induce and/or enhance immune responses. The coding sequences can be ligated with a coding sequence of another molecule such as M. tuberculosis antigens, a cytokine or an adjuvant and can be used in vivo as a DNA vaccine. This polymucleotide sequence represents the DNA encoding the Ral2 on 06-AUG-2003 to correct OS field.)

The DNA is useful for the recombinant production of the fusion protein. Coding sequences for the antigens were modified by PCR in order to facilitate their fusion and subsequent expression of the fusion protein, and then ligated. The invention provides fusion protein, and then ligated. The invention provides fusion proteins (see ANY32059-71) containing at least 2 M. tuberculosis antigens. The new fusion proteins and polymucleotides encoding them are useful as vaccines for preventing tuberculosis (claimed), for diagnosis (via in vitro assays or intradermal skin tests for detection of anti-M. tuberculosis antibodies), monitoring of disease progression, and treatment of tuberculosis. They are more effective
                                                                                                                                                                                                                                                                                                                                                                                                          100

                                                                                                                                                                                                                                                     S
S
The invention relates to a recombinant nucleic acid molecule encoding a fusion polypeptide, comprising a polynucleotide sequence of Ral2, a 14 Kbaicon polypeptide, comprising a polynucleotide sequence of Fal2, a 14 Mycobacterium tuberculosis, and a heterologous polynucleotide sequence. The recombinant fusion nucleic acids and polypeptides are useful for providing stable and high yield expression of fusion polypeptides of both eukaryotic and prokaryotic origin and to encode a protein product for use as an antigen for detecting serum antibodies. The presence of serum antibodies to M. tuberculosis antigens in an individual indicates that the individual is infected with it. The fusion polypeptides are useful as sources of proteins for monitoring binding of serum antibodies to fusion proteins and as an immunogen to induce and/or enhance immune responses. The coding sequence of another molecule such as M. tuberculosis antigens, a cytokine or an adjuvant and can be used in vivo as a DNA vaccine. This polymucleotide sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          IleThrAlaValAspGlyAlaProlleAsnSerAlaThrAlaMetAlaAspAlaLeuAsn 100

response of Mycobacterium tuberculosis. Polypeptides of the invention are useful for diagnosing, treating or preventing M. tuberculosis infection, particular, the polypeptides are useful as a vaccine formulation with an adjuvant to afford long-term protection in animals against the development of tuberculosis. The protein coding sequence may be used to encode a protein product for use as an immunogen to induce and/or enhance an immune response to M. tuberculosis. This sequence represents DNA encoding an M. tuberculosis thusion protein of the invention. This polymucleotide encodes 3 different proteins, each in a different reading frame. (Updated on 29-AUG-2003 to standardise OS field)
